

CLAIMS

What is claimed is:

1. An applicator with sealed fluid comprising:
 - an elongated housing with a first sealed end and a second open end;
 - one or more substances enclosed within one or more capsules disposed within said elongated housing near said first sealed end;
 - a hollow tube with a first end and a second end and with a sharp point capable of puncturing the capsule provided at said first end; and
 - an applicator tip affixed to said second end of said hollow tube;
 - wherein when the second end of the hollow tube is inserted into the elongated housing, it will puncture the capsule thereby releasing the substance in the capsule and forcing the substance into the applicator tip through the hollow tube due to the displacement of the volume in the elongated housing by the inserted hollow tube.
2. An applicator with sealed fluid as in claim 1, wherein said capsule is made of aluminum foil or plastic.
3. An applicator with sealed fluid as in claims 1 or 2, wherein said substance is a cream, a lotion, a medication, or a cosmetic.
4. An applicator with sealed fluid comprising:
 - an elongated housing with a first sealed end and a second open end;
 - a protrusion with a sharp point is provided near said first sealed end;
 - one or more substances enclosed within one or more capsules disposed within said elongated housing near said protrusion with a sharp point;
 - a hollow tube with a first end and a second end; and

an applicator tip affixed to said first end of said hollow tube;

wherein when the second end of the hollow tube is inserted into the elongated housing, it will urge the capsule against the sharp point and rupture the capsule thereby releasing the substance in the capsule and forcing the substance into the applicator tip through the hollow tube due to the displacement of the volume in the elongated housing by the inserted hollow tube.

5. An applicator with sealed fluid as in claim 4, wherein said capsule is made of aluminum foil or plastic.

6. An applicator with sealed fluid as in claims 4 or 5, wherein said substance is a cream, a lotion, a medication, or a cosmetic.

7. An applicator with sealed fluid comprising:
an elongated housing with a first sealed end and a second open end;
one or more substances enclosed within one or more capsules disposed within said elongated housing near said first sealed end; and
a hollow tube with a first end and a second end with an applicator tip affixed to said first end of said hollow tube;
wherein when said second end of the hollow tube is inserted into the elongated housing, it will rupture the capsule thereby releasing the substance in the capsule and forcing the substance into the applicator tip through the hollow tube due to the displacement of the volume in the elongated housing by the inserted hollow tube.

8. An applicator with sealed fluid as in claim 7, wherein said capsule is made of aluminum foil or plastic.

9. An applicator with sealed fluid as in claims 7 or 8, wherein said substance is a cream, a lotion, a medication, or a cosmetic.
